

For a **healthcare industry in Singapore**, the three drivers can be explained very clearly using examples such as **hospitals, polyclinics, clinics, pharmacies and telemedicine providers**.

Digital Transformation Drivers in Healthcare

1. Market Drivers — “Why must healthcare organisations change?”

Market drivers are **external pressures affecting the healthcare industry**.

Market Driver	Healthcare Example in Singapore	Effect on Healthcare
Ageing population	Singapore has a growing elderly population requiring more healthcare services.	Healthcare providers need more efficient ways to manage patients and chronic diseases.
Rising healthcare demand	More people require treatment for chronic conditions and long-term care.	Drives digital monitoring, telehealth and preventive healthcare.
Healthcare cost pressure	Healthcare providers need to improve productivity while managing costs.	Encourages automation, AI and digital workflows.
Competition between providers	Private hospitals and clinics compete on service quality and patient experience.	Providers invest in digital services to differentiate themselves.
Government healthcare initiatives	Singapore’s Healthier SG programme focuses on	Encourages providers to use digital systems to

	preventive and population health.	engage and monitor patients.
Need for healthcare accessibility	Patients may need healthcare services without physically visiting a hospital or clinic.	Encourages telemedicine and remote healthcare services.
Healthcare workforce pressure	Doctors, nurses and other healthcare professionals face increasing workloads.	Creates demand for automation and AI-assisted processes.

Example

A traditional healthcare model might be:

Patient → Clinic → Doctor → Diagnosis → Treatment

Market pressures are encouraging healthcare organisations to develop:

Patient → Digital Platform → Remote Consultation → Data → AI/Analytics → Personalised Care

2. Technology Drivers — “What makes transformation possible?”

Technology drivers are the **technologies that enable healthcare organisations to provide new services and operate differently.**

Technology Driver	Healthcare Example	How It Helps
Artificial Intelligence (AI)	AI-assisted analysis of medical images and patient information	Supports diagnosis and clinical decision-making

Telemedicine	Online consultations with doctors	Allows patients to receive care without visiting a clinic
Electronic Medical Records (EMR)	Digital patient records	Makes patient information easier to access and share appropriately
Internet of Things (IoT)	Wearable devices monitoring heart rate, glucose or other health indicators	Enables remote patient monitoring
Cloud computing	Healthcare applications and data hosted on secure cloud infrastructure	Supports scalable digital services
Data analytics	Analysing patient and population health data	Helps identify trends and high-risk patients
Mobile applications	Healthcare apps for appointments, medication and health information	Gives patients greater control over healthcare
Robotics and automation	Automated pharmacy or administrative processes	Reduces repetitive manual work
Digital identity and authentication	Secure digital access to healthcare services	Improves convenience while protecting patient information

Singapore example: National Electronic Health Record

Singapore's **National Electronic Health Record (NEHR)** is an excellent example of technology supporting digital transformation.

Instead of patient information being completely isolated within one organisation, authorised healthcare professionals can access relevant health information across participating healthcare settings.

This changes the model from:

Hospital A → its own patient information

to:

Healthcare ecosystem → connected patient information → authorised healthcare providers

3. Customer Drivers — “What do patients expect?”

Customer drivers are changes in **patient expectations and behaviour**.

Customer Driver	Patient Expectation	Digital Response
Convenience	“I don’t want to travel to a clinic for every consultation.”	Telemedicine
Speed	“I want an appointment quickly.”	Online booking systems
24/7 access	“I want healthcare information whenever I need it.”	Healthcare apps, portals and chatbots

Personalisation	"I want healthcare based on my individual needs."	Data analytics and personalised health programmes
Transparency	"I want to see my medical information."	Patient portals and digital health records
Mobile access	"I want to manage healthcare using my phone."	Mobile healthcare applications
Continuous monitoring	"I want my health monitored between appointments."	Wearables and remote monitoring
Faster communication	"I want to communicate with my healthcare provider easily."	Secure messaging and digital consultation
Less paperwork	"I don't want to fill out the same forms repeatedly."	Digital registration and electronic records

Putting the Three Drivers Together

A useful classroom example is **chronic disease management**.

MARKET DRIVER

Singapore has an ageing population and increasing demand for healthcare services.

Healthcare providers need to manage **more patients efficiently**.

TECHNOLOGY DRIVER

Wearable devices + mobile apps + cloud + AI + data analytics

Healthcare providers can monitor patients **remotely**.

CUSTOMER DRIVER

Patients want convenient healthcare without having to visit a clinic for every check-up.

DIGITAL TRANSFORMATION

Remote Patient Monitoring

For example:

Patient

Wearable Device

Health Data

Mobile App

Healthcare Platform

AI / Data Analytics

Doctor / Care Team

Personalised Intervention

Patient

This creates a **continuous healthcare relationship** rather than a healthcare interaction that happens only when the patient visits a clinic.

Traditional Healthcare

Patient feels unwell → Visits clinic → Doctor examines patient → Treatment → Patient goes home

Digitally Transformed Healthcare

Patient → Mobile App → Teleconsultation → Digital Medical Record → AI/Data Analysis → Doctor → Digital Prescription → Remote Monitoring → Follow-up

The important point is that **digital transformation does not simply mean putting healthcare services online.**

It can change the **entire healthcare business model and patient journey.**

Easy Framework to Remember

Driver	Key Question	Healthcare Example
Market Driver	Why change?	Ageing population, rising healthcare demand, cost pressure
Technology Driver	What enables change?	AI, telemedicine, IoT, EMR, cloud, analytics
Customer Driver	What do patients want?	Convenience, speed, personalised care, mobile access

Digital Transformation	What changes?	Remote monitoring, digital healthcare ecosystem, personalised healthcare
-------------------------------	----------------------	--
